Abstract

This thesis explores the upcoming changes in English language education, focusing on the shift from traditional classrooms to digital environments. As technology advances, the focus of learning is moving away from strict grammar rules toward real-world communication skills. The research highlights the importance (AI) and mobile applications in providing personalized lessons for students. The study concludes that while technology is powerful tool, the emotional support of a teacher remains essential. The goal of this paper is to provide a roadmap for students and schools to adapt to these modern educational trends.

Key words: English Language Teaching (ELT), Artificial intelligence (AI), Digital Literacy, Communicative Competence, EdTech, Personalized Learning Blended Learning.

The Future of English Learning:

Technology and New Ways of Speaking Introduction (Research Importance/Urgency)

English is now the most important language in the world for science, business and travel, but English language teaching (ELT) in school is changing very fast. In the past we learned with books and pens. Now, we have the Internet and mobile phones. We must know how to learn faster and better because English is necessary skill for future success.

Research Goals and Objectives Ultimately the project is trying to see what English lessons are like in a few years' time.

Our objectives are:

-To show how computers and AI (Artificial Intelligence) help students

- To argue that speaking is more important than learning the rules about grammar.
- To find out if teachers are still necessary in the future.

Methodology (Methods)

We did this by asking students about their experiences with English-related apps (like Duolingo or You Tube), as well as comparing classroom English-teaching with less customary, online-based teaching, like lessons via video calls and apps. Some students and teachers we spoke to felt that there were positive aspects to using technology in English lessons.

Main Body (Results and Discussion)

1. Learning with AI and App

Future students will have a “digital tutor”. If you make a mistake, the computer tells you at once, and you correct it. This is especially good for those students who are shy to speak in front of the whole class. You can practice whenever and whenever you want.

2. Focus on Communication

It took students years to learn "The Present Perfect Tense", but they could not, for example, order in a restaurant. The future is about communication. Schools will have to place more:

- Talking to people from different countries.
- Watching videos and understanding various accents.
- Collaborating on projects conducted in English.

3. The role of the teacher.

Computers are smart but have no feelings, so the teacher's job will change from imparting knowledge to that of a "coach" who keeps the students motivated and interested.

Conclusion and Recommendations

Ultimately, the future of English education will be high-tech and an adventure, rather than a mindless exercise in learning boring facts. Don't worry about making mistakes. The point is to communicate, to be understood. Watch and Listen: Movies and music in English every day will familiarize you with the natural sound and rhythm of the language.
